skeletal muscle cDNA library. The GIP90 gene was localised to chromosome existence of an adenine at position 2720 in the cDNA that was not present in GIP90 genomic DNA. Another CDNA fragment was isolated that was not present in GIP90 genomic DNA. Another CDNA fragment was isolated that encoded a LIO kDa protein (GIP100, see ABR6221) and resulted from faithful transcription and translation of the GIP90 genomic sequence (i.e. no AZ720). GIP90/130 polypeptides interact with GPBP and are capable of modify GP90/130 aggregation, and to modify GPBP-GIP90/130 interactions, to modify GP90/130 aggregation, and to modulate gene expression. The invention provides GIP90/130 polypeptides, portions of them, antibodies, mucleic acid sequences, expression vectors and host cells, as well as methods for detecting GIP90/130 polypeptides and nucleic acids, and methods for treating an autochmune disease or cancer by modifying the expression or activity of one or more GIP90/130 polypeptides

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1325
                                                                                                                                                                                                                                                                                                                                                                                                                                           GAAGTGGAGAGTCTGCGCAAGCGCGTGCTTGAGATGGAGGGCCAAGGATGAAGAGATCACG 1265
                                           The present sequence is that of a 785-amino acid polypeptide that is present in the movel Goodpasture antigen binding protein (GPBP) interacting protein GIPPJO (GREP ABR62251). The polypeptide lacks critical regions of GIP90/130 polypeptides implicated in GPBP interaction and induction of gene expression, but contains sequences that downerequate interaction with GPBP. The polypeptide, or antibodies to it, can be used to modify GPBP-GIP90/130 polypeptide interactions or to modify GPBP-GIP90/130 polypeptides proteins of them, antibodies, mucleic acid sequences, expression vectors and host cells, as well as methods for detecting GIP90/130 polypeptides and nucleic acids, and methods for treating an autoimmune disease or cancer by modifying the expression or activity of one or more GIP90/130 polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  140

The present invention relates to a method for diagnosing breast cancer in a subject suppercted of having endomerizal cancer. The method comprises determining the expression of a set of human genes or expression products in an endomerizal sample suspected of being cancerous. The human genes of the invention are differentially expressed in breast tumours characterised as high or low MAI (mitotic activity index). These sets of genes can be used to discriminate between high and low MAI breast tumours. The invention also provides DNA and protein microarrays for analysing the expression of the human genes and their protein products. The methods and arrays are useful for the diagnosis and prognosis of endometrial cancer, selecting and monitoring treatment regimes, and identification of compounds useful for the treatment regimes, and identification of compounds useful for the treatment of endometrial cancer. MAUS4361 represent the human proteins of the invention that are differentially expressed in breast cancer tissue Diagnosing breast cancer comprises determining expression of nucleic a motecules or expression products that are differentially expressed in normal and malignant tissue. Claim 37; Page 141-143; 219pp; English WPI; 2002-180084/23. N-PSDB; ABK35549.

ACF12828 to ACF12947 encode the human cervical cancer marker proteins (I) given in ABF92047 to ABF92164. A higher level of expression of (I) than normal indicates the presence of cervical cancer. Also described: (I) a vector (II) containing (I); (2) a host call (III) containing (I); and (3) assessing (MI) whether a patient is afflicted with cervical cancer, comparing the level of expression of a marker in a patient's cample, and the normal level of expression of the marker in a control non-cervical cancer sample, where a significant increase in the level of expression of the marker in the patient's sample relative to that in the control sample is an indication that the patient is afflicted with cervical cancer. (I) has cytostatic activity, and can be used in gene therapy and in vaccines. (I) is useful in detecting, characterising, therapy and the indication than cervical cancers. (I) may also be used in various prognostic assays, pharmacogenomics and in monitoring clinical trials
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1115

The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and evrocated activity. The polymucleotides are useful in gene therapy. A composition containing a polypeptide or polymucleotide of the invention may be used to treat disease of the peripheral nervous such as peripheral nervous injuries, peripheral nervous and contral nervous system disease, amyotropathy and localised neuropathies and central nervous system disease, amyotrophic lateral sclerosis, and Shy-brager Syndrome. Other uses include the utilisation of the activity, chemotextic/chemokinetic activity, haemostatic and thrombolytic activity, chemotextic/chemokinetic activity, haemostatic and thrombolytic activity, archititis and inflammation, leukaemias and c. N. S disorders. Note: The sequence data for this patent did not form bart of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                 φ,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel nucleic acids and polypeptides, useful for treating disorders such as central nervous system injuries.
                                                                                                                                                                                                                                                                                                                                                                                                 Wang D;

Sequence 6, Application US/10309851

Publication No. US20030108554A1

GENERAL INFORMATION:

APPLICANT: Saus, Usan

APPLICANT: Revert-Ros, Francisco

TITLE OF INVENTION: GIPs, a Family of Polypeptides with Transcription Factor Activity

TITLE OF INVENTION: Interact with Goodpasture Antigen Binding Protein

TITLE REFERENCE: 98,723-F-US

CURRENT APPLICATION NUMBER: US/10/309,851

CURRENT FILING DATE: 2002-12-04

NUMBER OF SEQ ID NOS: 38

SOFTWARE: Patentin version 3.1

SEQ ID NO 6

LENGTH: 265
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   960 CTCAAGTTAGAAGTGGACTTCGAACACAAGGCCTCGAGGTTTTCCCAGGAGCACGAAGAG 1019
